

Exercise 1: Based on the sources referenced above.

- Compare conventions of naming and formatting between common languages C# and Java.
- Create a detailed comparison with descriptions in words and save it as a Word or PDF file.

Criteria	C# (.NET – Microsoft conventions 2025+)	Java (Oracle/Sun conventions)	Example	Notes / Remarks
Class / Record / Struct names	PascalCase CustomerService	PascalCase CustomerService	class CustomerService { }	Same in both languages
Interface names	PascalCase with I prefix IRepository	PascalCase, no prefix List	IRepository vs List	C# uses I to identify interfaces
Method names	PascalCase GetUserById()	camelCase getUserById()	GetUserById() vs getUserById()	Most noticeable difference
Local variables & parameters	camelCase userName, maxVal	camelCase userName, maxVal	int userId;	Same convention
Private / instance fields	_camelCase or camelCase _userId	camelCase userId	_userId vs userId	_ is common in C#

				private fields
Constants	PascalCase or UPPER_CASE MaxLength	UPPER_CASE_WITH_UNDERSCORES MAX_LENGTH	MAX_LENGTH	Java is stricter
Properties	Built-in properties UserName { get; set; }	No properties Uses getters/setters	UserName vs getUsername()	C# syntax is cleaner
Namespace / Package	PascalCase, flexible EIU.CSE.StudentManagement	lowercase, reverse domain vn.eiu.cse.studentmanagement	EIU.CSE vs vn.eiu	Java strongly enforces reverse domain
Source file name	Must match public class UserService.cs	Must match public class UserService.java	One public class per file	Same rule
Brace style { }	Allman style Brace on new line	K&R style Brace on same line	{ new line vs same line	Style difference
Indentation	4 spaces (official guideline)	4 spaces (sometimes 2 by team)	~~~~~	Mostly the same
Implicit typing (var)	Supported and recommended	Not supported	var list = ...	C# is more modern
Documentation comments	/// XML Documentation	/** Javadoc */	/// <summary>	Same purpose, different syntax
