

```

/*
 * PART 1: IDENTIFICATION AND EXPLANATION OF ISSUES
 * -----
 * * 1. Naming Conventions:
 * - Class name 'user' starts with a lowercase letter. In C#, classes must use
 * PascalCase (e.g., 'User').
 * - Parameter names 'Name' and 'Age' in the constructor use PascalCase. Standard
 * C# practice for method/constructor parameters is camelCase (e.g., 'name', 'age').
 * * 2. Access Modifiers:
 * - The class 'user' and fields 'name', 'age' lack clear access modifiers.
 * While they default to 'internal' (class) and 'private' (fields), it is best
 * practice to state them clearly for code maintainability and understanding.
 * * 3. Constructor Name:
 * - The constructor 'public user' must match the class name exactly. Since the
 * class should be renamed to 'User', the constructor must also be updated to
 * 'public User'. C# is case-sensitive.
 * * 4. Encapsulation and Properties:
 * - The fields 'name' and 'age' are private with no public accessors (getters/setters).
 * - C# best practice recommends using Properties instead of raw fields to
 * properly encapsulate data and allow for future validation logic.
 * * 5. Field Naming (if using explicit fields):
 * - If private fields are used, they should follow the '_camelCase' convention
 * (e.g., '_name') to distinguish them from local variables or properties.
 */

```

// PART 2: REWRITTEN CLASS FOLLOWING C# BEST PRACTICES

```

```

using System;

```

```

namespace CodingStandards
{
    public class User
    {
        public string Name { get; set; }
        public int Age { get; set; }

        public User(string name, int age)
        {
            Name = name;
            Age = age;
        }
    }
}

```
